

Biochem

AVEVE Biochem develops, manufactures and sells biochemical specialities worldwide for the animal feed niche market. They are manufactured by AVEVE or third parties in compliance with the formulations of AVEVE Biochem.

AVEVE Biochem customers are premix companies, feed manufacturers and large self-mixing stock farms, mainly in Asia and Europe. Market prospecting and sales is managed directly and through a network of distributors.

AveMix® Enzymes

AVEVE Biochem has developed different AveMix® Enzyme concepts aiming to break down the fibres present in pig and poultry feed. AveMix® NSP hydrolysing enzymes improve animal performance due to a higher digestibility of the feed. The addition of AveMix® Enzymes allows the customer to include high levels of raw materials (such as corn, wheat, barley, rye, soy, tapioca, etc.) in the feed.

Furthermore, the use of by-products such as rapeseed meal, copra meal, rice bran, palm kernel meal, etc. can be optimised.

AveMix® MCT

AveMix® MCT is the antimicrobial oil offered by AVEVE Biochem. The unique fatty acid composition and its slow-release effect strengthens the animal and helps it to maintain a healthy status. After thorough research and triggered by the European antibiotic ban at the beginning of 2006, AVEVE Biochem has developed and validated this 'medium chain glyceride' oil in antibiotic-free monogastric feeds. The (re)search for new applications of AveMix® MCT is continuously evolving.

AveMix® Services

AveMix® Services give advice and evaluate feed formulations for optimal enzyme composition and usage. Reformulating feed with AveMix® enzymes can optimise animal performance and/or make significant savings on the feed formulation costs. AVEVE Biochem also offers specialised analysis of feed raw materials and feeds in combination with its AveMix® products.
